1
2001-01-29

Purpose of Transport Layer

- Transport Layer provides communication from an application to another application (= end-to-end communication)
- May be reliable or unreliable
- Must accept data from several applications

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks

3
2001-01-29

User Datagram Protocol (UDP)

Comer's
chapter 12 (3rd and 4th ed.)

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

4
2001-01-29

Repetition of UDP

- User Datagram Protocol (UDP)
- Light protocol
- Several application programs may work in a host: UDP uses ports
- Unreliable connectionless delivery service
 - No acknowledgements, no retransmissions
 - Checksum (error detection) is optional

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

5
2001-01-29

UDP Message Format

0	16	31
UDP SOURCE PORT		UDP DESTINATION PORT
UDP MESSAGE LENGTH		UDP CHECKSUM
DATA ...		

- Source port and checksum are optional
- Length: header + data length in octets
- Ports act as subaddresses in one host

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

6
2001-01-29

UDP Pseudo-header

0	8	16	31
SOURCE IP ADDRESS			
DESTINATION IP ADDRESS			
ZERO	PROTOCOL	UDP LENGTH	

- Pseudo-header is used to verify that packet has reached the correct destination
 - IP addresses from IP header
 - Protocol number (17 = UDP) from IP header
 - Length of UDP datagram (UDP header + data)
- Pseudo-header is not sent over the network

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

7
2001-01-29

Calculation of UDP Checksum

- Checksum is calculated from pseudo-header, UDP header and data.
 - Checksum is zero before calculation
 - Divide all data to 16 bits long pieces
 - Calculate one's complement sum from the pieces
 - Take one's complement from the result
- Checksum is similar in TCP

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

8
2001-01-29

Ports and (De)Multiplexing

- Well-known ports
 - for standard protocols
 - www.iana.org
 - RFC 1700 (1994)
 - 0-1023
- Reserved ports
 - for services
 - 1024-49151
- Dynamic/private ports
 - 49152-65535

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

9
2001-01-29

Summary

- User Datagram Protocol (UDP) offers connectionless unreliable delivery service
- UDP adds multiplexing in a host to service offered by IP
- Ports are divided to well-known, reserved and private ports

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks

Transmission Control Protocol

Comer's
chapter 13 (3rd and 4th ed.)

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

12
2001-01-29

Repetition of TCP

- Transmission Control Protocol (TCP)
 - Connection-oriented
 - end-to-end (process-to-process)
 - Reliable
 - Two-way
- Applications usually need reliable data transmission over unreliable networks

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

13
2001-01-29

Reliable Delivery Service

- Repetition from TLARK: Characteristics of reliable delivery service:
 - Stream orientation
 - Virtual circuit connection
 - Buffered transfer
 - Unstructured stream
 - Full duplex connection

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

14
2001-01-29

Required Functions to Implement Reliable Delivery Service

- Basic Data Transfer
- Reliability
- Flow control
- Multiplexing
- Connections
- Precedence and Security

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

15
2001-01-29

Connection

- Identifier: pair of endpoints
 - Endpoint: (host, port) pair
 - For example: (130.233.45.31, 6000) and (130.233.220.31, 85) is an identifier
- A connection contains information:
 - Window size, sockets, sequence numbers, and other information needed for maintain the connection.

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

16
2001-01-29

TCP Header Format (RFC 793)

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

17
2001-01-29

TCP Header - Options

- 0 = End of option list
 - After all options
- 1 = No-operation
 - Sometimes used between options
- 2 = Maximum Segment Size
 - In connection establishment, peers agreed on the maximum segment size

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

18
2001-01-29

Fig. 13.15

State Machine of TCP

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

19
2001-01-29

Sequence Numbers

- Begin from some value (not always 1)
- Calculate octets in data stream from the initial value
- Sequence numbering for both directions
- Used in acknowledgements

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

20
2001-01-29

Connection Establishment

- Three-way handshake

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

21
2001-01-29

Closing Connection

- Modified three-way handshake
 - Other end does not have data to send: closing the connection in one direction
 - The sender sends a segment with a FIN bit set
 - ← The receiver acknowledges the FIN with ACK
 - No data to send also to other direction
 - ← Receiver sends FIN
 - Sender ACKs the FIN segment

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

22
2001-01-29

Reliable Transmission

- Reliable delivery = data is delivered from one machine to other machine without duplicates or losses
 - Positive acknowledgements
 - Retransmissions
 - Error detection (timers, checksums)

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

23
2001-01-29

Idea of Sliding Window

- More efficient transmission
 - A packet can be sent before previous packet has been acknowledged
 - Buffer for unacknowledged packets

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

24
2001-01-29

TCP Window Mechanism

- For end-to-end flow control
 - Can also help avoiding congestion
- At each end, there are two windows
 - One for sent packets and one for received packets
- Window size can vary
 - How many octets the receiver can accept

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

25
2001-01-29

Silly Window Syndrome (SWS)

- Applications with different speeds
 - Receivers buffer become full
 - It reads one octet and advertises window size 1
 - Sender sends one octet in a TCP packet
- Silly window may occur on both sender and receiver sides
- Small amount of data compared to header
- More calculation and processing

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

26
2001-01-29

Avoiding SWS

- Receiver side
 - Advertise only "significantly" large window
 - Delayed acknowledgements
- Sender side
 - Wait until enough data to send a maximum size segment
 - Wait until an acknowledgement arrives

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

27
2001-01-29

Acknowledgements

- Cumulative acknowledgements
 - Easy to generate and unambiguous
 - Lost acknowledgements does not necessary generate retransmissions
 - Usually several sequences are acknowledged in one message
 - Sender either send all again or send only the first unacknowledged sequence

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

28
2001-01-29

Retransmission

- If no acknowledgement arrives in a time interval, the packet is retransmitted
- Adaptive retransmission algorithm
 - TCP measures performance of connections
- Round trip time
 - $RTT = (\alpha * oldRTT) + ((1 - \alpha) * newRTTsample)$
- Timeout: $\beta * RTT$, $\beta > 1$

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

29
2001-01-29

Acknowledgement Ambiguity

- TCP uses cumulative acknowledgments
- If a retransmission is sent, which sequence the acknowledgement belong to?
 - original datagram: longer timeouts
 - retransmitted datagram: too sort timeouts
 - discard these in the round trip calculation – not a good solution
- Timer backoff strategy

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

30
2001-01-29

Variance in Delay

- Goal: retransmission timer is near actual roundtrip time
 - Also variance in round trip time is followed
 - More calculation that effects to the timer

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

31
2001-01-29

Congestion

- Congestion occurs at a switching point (e.g. router) somewhere between the endpoints
- Congestion means increased delay
- Transmission rate must be reduced to avoid congestion collapse
 - Congestion window

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

32
2001-01-29

Global Synchronization

- Congestion has occurred in the network
- All machines start sending at the same time
- Random Early Discard (RED) in routers
 - if queue is full → discard datagram
 - when queue is almost full → discard datagram with some probability
 - when queue is not full → deliver datagrams

Sanna Liimatainen
verkot@tml.hut.fi

Tik-110.350 Computer Networks
<http://www.tml.hut.fi/Studies/Tik-110.350/>

33
2001-01-29

Summary

- Transmission Control Protocol (TCP) offers connection-oriented, reliable delivery service
- Efficient use of network
- Flow control tells how much data can be handled in both endpoints

Sanna Liimatainen
verkot@tml.hut.fi
